

# Multi Echelon Inventory Optimization

Key Assumptions

# MEIO – Pulp Key Assumptions

**Objective → Minimize  
Holding cost & achieve  
service level above 95%**

# Model Assumptions

- Objective → Minimize Holding cost & achieve service level above 95%
- Factory 1 Daily Prod = 100
- Factory 2 Daily Prod = 180
- F1 dispatch quantum = 10
- F2 dispatch quantum = 10
- F1 Dispatch Limit = 15 quantum
- F2 Dispatch Limit = 15 quantum
- RDC 1 Dispatch Quantum = 10
- RDC 2 Dispatch Quantum = 10
- RDC 1 Dispatch Limit = 30 quantum
- RDC 1 Dispatch Limit = 45 quantum
- Factory QA inspection = 1 day
- Factory to RDC LT = 3 days
- RDC to Customer LT = 2 Days

factory\_holding\_cost = 1/unit  
rdc1\_holding\_cost = 2/unit  
rdc2\_holding\_cost = 1.8/unit  
customer\_holding\_cost = 0.5/unit  
slack\_cost = 100 (Unmet Demand)

F1 Opng = 340  
F2 Opng = 300  
RDC 1 Opng = 220  
RDC 2 Opng = 260  
Customer 1 Opng = 130  
Customer 2 Opng = 190  
Customer 3 Opng = 160

C1 Demand =  
Normal(Mean=65,Sigma=35)

C2 Demand =  
Normal(Mean=100,Sigma=50)

C3 Demand =  
Normal(Mean=35,Sigma=8)

**Objective → Minimize Holding cost & achieve service level above 95%**

# Model Output

F1 Opng Units & Days

F2 Opng Units & Days

- The model tolerates inventory days fluctuations at Factories & RDC. However it suggests to keep 1 day inventory at customer locations.
- Service level obtained = 98.28% at the customer echelon.

RDC1\_Opng\_Units & Days

RDC2\_Opng\_Units & Days

C1\_Opng\_Units & Days

C2\_Opng\_Units & Days

C3\_Opng\_Units & Days
